

Legends of areas : displays legends of status instead of my styles

"I'm inserting a legend of areas, but it's a legend of statuses that's being displayed."

The legend of areas is populated at the time of its creation by the values of the "Areas color" property on the Deliverable tab:

If it is the status colors that appear in the legend, it is because the "Areas color" field was set to use the status color (when the legend was created).

You'll need recreate the legend by first re-setting the "Areas color" control with the Task field control corresponding to the style.
